CLAIMS

-			aim			
	\sim	- 1	\rightarrow	7	m	
	_	_	а	ㅗ	ш	

- 1. A motor brake structure comprising:
- a rotor;
 - a rotor axis relatively fixed to the rotor;
 - a soft material brake having a central portion thereof into which the rotor axis is inserted, the soft material brake rotating identically with the rotor axis; and

a case formed at an outer side of the brake, wherein the soft material brake has a base part having a mortise into which the rotor axis is inserted; a flexible part circularly extended from an end of the base part; and a friction part extended from an end of the flexible part, having a friction surface formed at an outer circumference thereof, and large-sized relative to at least the flexible part.

- 2. The motor brake structure of claim 1, wherein the rotor axis is fitted into and fixed to the rotor.
- 3. The motor brake structure of claim 1, wherein the brake is formed as a single body.

- 4. The motor brake structure of claim 1, wherein the flexible part is gradually more large-sized at an outsider portion thereof.
- 5. The motor brake structure of claim 1, further comprising a brake latching end protruded such that the brake latching end inserted into the mortise is latched with the brake.
- 6. The motor brake structure of claim 1, further comprising a rotor latching end extended from the rotor axis, for fixing a position at which the rotor axis is fitted into the rotor.
- 7. The motor brake structure of claim 1, wherein the rotor has an inner circumference surface to which a hysteresis ring is fixed.
- 8. The motor brake structure of claim 1, wherein the flexible part is formed in an opposite direction to a reverse rotation direction of the motor.
- 9. The motor brake structure of claim 1, wherein the mortise and a brake fixing surface of the rotor axis

LITMAN LAW OFFICES, LTD. P.O. BOX 15035 9 ARLINGTON, VA 22215 (703) 486-1000 10 corresponding to the mortise have non-circular sections such that they are not slid with each other.

- The motor brake structure of claim 1, wherein the 10. flexible part has the least thickness at a connection portion of the flexible part and the base part.
- The motor brake structure of claim 1, wherein the friction surface is rounded.
- claim 12. motor brake structure of 1, further The comprising a rotor bushing as a separate part for allowing the rotor axis to be fixed to the rotor.
 - A pipeline opening and closing device comprising:
- a motor unit for generating a rotation force by a power supply applied from an external;
- a deceleration unit for decelerating a rotation speed of the motor unit;

an actuator for allowing a pipe to be opened and closed by the rotation force transmitted from the deceleration unit; and

a braking unit having a brake for decelerating a reverse rotation speed of the motor unit by a friction force generated by deflecting toward and contacting a friction part formed at an 1 2

outer side with a case by an eccentric force when the motor unit is reversely rotated.

- The pipeline opening and closing device of claim 13, wherein the motor unit is a hysteresis motor.
- The pipeline opening and closing device of claim 13, 15. wherein the brake is formed of a soft material.
 - A motor brake structure comprising:
 - a rotor;
 - a rotor axis fixed to the rotor;
- a soft material brake having a central portion thereof into which the rotor axis is fitted, the soft material brake rotating identically with the rotor axis, and having a base part into which the rotor axis is fitted, at least two flexible parts extended from the base part, and a friction part formed at an end of the flexible part; and
- a case formed at an outer side of a brake, for contacting with the friction part to decrease a rotation speed of the rotor when the rotor is reversely rotated.
- 17. The motor brake structure of claim 16, wherein he friction part has an outer circumference surface rounded.

- *
- 2 brake is formed as a single body of a rubber or silicon

- 19. The motor brake structure of claim 16, wherein the flexible part and the friction part are stepped to each other at a connection outer circumference surface thereof.
- 20. A manufacturing method of a motor brake, the method comprising the steps of:
 - inserting a rotor axis into a rotor; and
- inserting and fixing an end of the rotor axis passing through the rotor, into and to a soft brake.
- 21. The manufacturing method of claim 20, wherein the rotor axis is fitted into and fixed to the rotor.
- 22. The manufacturing method of claim 20, wherein the rotor has an inner circumference surface to which a hysteresis ring is fixed.
 - 23. A motor brake structure comprising:
 - a rotor;
 - a rotor axis inserted into and fixed to the rotor;

a soft material brake fixed to an outer circumference of the rotor axis to expand an end thereof when the rotor is reversely rotated; and

a case being in contact with the brake when the brake is expanded, for decreasing the rotation speed of the rotor.
